1 DAY 1

So far have been taking picture of a small glass inside of water to see how much the water rises upwards the glass piece and then tried to put in different solution in the water in order to weaken or increase the water tension. Some problems that occurred was that picture was very blurry but it possible to see that the water tension was stronger or not. I have been able to test two solutions, but also taken the picture next to each other for comparison and is now working on other methods and ideas but come pretty far
